

naturaSign Pad Mobile

A robust design for use whilst on the move

The enlarged black-and-white screen means that this pad offers even more space for signatures: even scrawled handwriting is no longer a problem. The tried-and-tested "rotate" function enables you to turn the signature line 180°, so left-handers can also sign comfortably.

New resistive design!

The new, flat touch display coupled with easy-care casing offers a convenient method of signing, with no sharp edges or corners. Grime doesn't stand a chance!

More than just a signature...

Now you can insert individual text on the screen, as well as position interactive buttons or your company logo. The high-resolution LCD ensures that your inserts will be clearly displayed.

Space-saving but stable!

A pad with LCD screen that's flatter than a CD case and therefore saves you plenty of space e.g. can be taken with you in a laptop bag. Nonetheless, it's very stable and meets the demands of daily use whilst on the move! The standard micro USB connection enables you to select your preferred connection lead length.

The naturaSign Pad Mobile takes into account the trend for increasingly large displays for more convenient handling.

The naturaSign Pad Mobile has been specially designed to meet the demands of mobile use, such as in field service. Thanks to the large LCD, extremely flat design (under 1 cm thick) and rounded edges, the naturaSign Pad Mobile is a highly compact yet stable and comfortable device for capturing signatures.

The certificate also enables the person checking the signed document to assign each signature to a particular signature pad. The signature pad's processor contains a public key from a second key pair (RSA 2048-bit), created by a notary public. This key already encrypts the biometric data in the pad. In this way, highly sensitive data is never found decrypted in the 'unsecured' environment – i.e. your computer (e.g. RAM).

The private key from this second key pair is safely stored by the notary public. The signature pad's unique security concept guarantees the user the highest-possible proof security, as he/she will be able to demonstrably claim that they have not changed or used the signature's biometric data other than for the purposes intended (by intercepting the memory and copying the data to another document).
